

On-chain infrastructure that is ready to **integrate.**

Kenostod IaaS gives payment networks, wallets, DeFi protocols, EdTech platforms, and institutions modular building blocks for settlement, liquidity, analytics, and automated operations.

5

PROTOCOL MODULES

API

SDK + WEBHOOK DELIVERY

24/7

MONITORING SURFACES

BSC

PRODUCTION FOUNDATION

Partners should not have to build five systems to launch **one product**.

PAYMENTS

Settlement without safety layers

Stablecoin and merchant flows need transparent fees, clear status, and a controlled response to user mistakes.

DEFI

Liquidity without operations

Protocols need routing, liquidity, monitoring, and execution tooling without assembling every component in-house.

INSTITUTIONS

Signals without a dashboard maze

Teams need a unified view of volume, liquidity, adoption, alerts, reports, and permissioned operations.

Kenostod's proposition: integrate the modules you need through APIs, SDKs, widgets, webhooks, or a white-label deployment — without licensing a concept or starting from zero.

01 / SETTLEMENT

UTL

Universal Transaction Layer for transaction and fee routing, settlement visibility, distributions, and wallet-facing experiences.

02 / LIQUIDITY

FAL + FALP

Flash Arbitrage Loan infrastructure and **Flash Arbitrage Loan Pools** for permissioned execution and participant liquidity.

03 / INTELLIGENCE

VLAT

Volume Liquidity Adoption Time scoring for ecosystem health, growth phases, market signals, and reporting.

04 / OPERATIONS

SOE

Sovereign Order Engine for orchestrating protocol operations, alerts, permissions, and unified reporting.

05 / SAFETY

Reversal Pool

An escrow-backed pending state for eligible transfers, giving an authorized sender a disclosed cancellation window before final settlement.

lifecycle **visible** and **programmable**.

UNIVERSAL TRANSACTION LAYER

A modular layer for fee collection, transaction routing, settlement state, distribution, staking, and partner-facing wallet experiences.

- ↳ Transparent transaction and service-fee flows
- ↳ Read APIs for treasury, staking, distribution, and positions
- ↳ Wallet connectivity and embedded transaction experiences
- ↳ Adaptable to a partner's token or settlement design

PARTNER DELIVERY

- ↳ REST API access for product and operations teams
- ↳ SDK and wallet integration for application developers
- ↳ Iframe or Web Component widgets for rapid deployment
- ↳ White-label branding for institutional or ecosystem use

FALP makes participation structured.

FAL · FLASH ARBITRAGE LOAN

Permissioned execution infrastructure

FAL monitors eligible markets and supports atomic flash-arbitrage execution across approved venues. Execution, risk thresholds, and permissions are configured for the deployment.

- ↳ Opportunity, quote, status, and execution surfaces
- ↳ Webhook-ready execution event reporting
- ↳ White-label or managed deployment options

FALP · FLASH ARBITRAGE LOAN POOL

Liquidity participation with an education layer

FALP provides a pool and staking experience around eligible FAL activity. Partners can expose pool statistics, positions, and reward actions through a branded interface.

- ↳ Pool information and contributor-position APIs
- ↳ Embeddable staking and reward experience
- ↳ Eligibility and economics disclosed per deployment

A controlled pause before settlement can prevent an irreversible **user mistake**.

UTL REVERSAL POOL

Eligible UTL transfers can enter a pending or escrow-backed state for a disclosed period before final settlement.

- ↳ Standard flow provides a five-minute reversal window
- ↳ Authorized sender can request cancellation before expiry
- ↳ Principal refund and any disclosed fee are shown transparently
- ↳ Status can be queried by transaction hash

IMPORTANT BOUNDARY

Safety without rewriting the chain

This feature does not roll back a finalized blockchain transaction. It operates at the application and settlement layer before finalization, with eligibility, authorization, timing, and fee rules enforced by the deployment.

LIVE · UTL product flow

PARTNER · adapter and pilot required

See the system. Operate the system. Improve the system.

VLAT

Volume Liquidity Adoption Time

VLAT turns volume, liquidity, adoption, and time into a shared operating view. It supports composite scores, ecosystem phases, revenue signals, feeds, snapshots, and alerts.

- ↳ Live score and phase views
- ↳ Cross-venue market and adoption feeds
- ↳ Historical and projected revenue reporting

SOE

Sovereign Order Engine

SOE is the orchestration layer for protocol operations. It coordinates monitoring, permissions, alerts, state, bot workflows, and recurring reports in one operational environment.

- ↳ Unified protocol-state dashboard
- ↳ Weekly reporting and operational alerts
- ↳ Custom configuration for partner deployments

partner.

SDK

Build into your frontend

Use wallet-aware SDK calls for staking, deposits, claims, transaction status, and partner-specific application flows.

WIDGET

Embed in your platform

Deploy UTL payment, reversal, FALP, and staking experiences through an iframe or Web Component without sending users to a separate destination.

WEBHOOKS

Stay event-aware

Receive execution, pool, phase, settlement, and operational events so the partner product can keep its own interface current.

WHITE-LABEL

Make it yours

Use partner branding, custom permissions, selected modules, and institution-specific reporting in a managed deployment.

DEPLOYMENT

users where they already are.

STABLECOIN + PAYMENTS

Settlement with a safety layer

Offer transparent UTL settlement, embedded payment flows, and an eligible pre-finalization reversal window for wallets, remittance products, and merchant platforms.

WALLETS + AGGREGATORS

More useful transaction surfaces

Connect users to token lifecycle, pool participation, analytics, and approved liquidity routes without breaking the wallet or aggregator experience.

DEFI PROTOCOLS

Liquidity and execution modules

Evaluate FAL/FALP adapters, pool access, monitoring, and routing with chain-specific risk controls and transparent partner terms.

EDUCATION + INSTITUTIONS

Learn, participate, operate

Use education-gated access, branded widgets, staking, and SOE/VLAT reporting to make on-chain participation easier to understand and manage.

Expand into the complete suite.

PILOT

Technical discovery

A scoped chain or product pilot with sandbox access, integration mapping, and measurable success criteria.

API ACCESS

Developer integration

Use selected APIs, SDK calls, webhooks, and widgets to add Kenostod capabilities to an existing product.

MANAGED

Partner deployment

A branded operational environment with selected modules, permissions, monitoring, and support.

STRATEGIC

Infrastructure alliance

Co-design a chain, aggregator, wallet, or institutional deployment with terms agreed around scope and responsibilities.

Let's turn your next user flow into **working infrastructure.**

We are looking for chains, wallets, payment networks, DeFi protocols, EdTech platforms, and institutions that want to test a real integration — starting with a technical discovery call and a scoped pilot.
